ABSTRACT

In the current situation the world is facing severe environmental problems such as climate change, global warming, pollution, acid rain, deforestation and biodiversity loss demand an urgent action for protection of the environment. This paper explores the concept of Environmental Education (EE) as it plays a significant role in addressing the environmental issues and fostering environmental conservation . This paper includes the review of various researches conducted on EE. In this paper, the researcher first explores the origin, objectives and components of Environmental Education. This paper also throw light on the national environmental issues and global environmental issues which are addressed through EE because Environmental Education plays a vital role in highlighting the environmental issues. EE fosters the sustainability, environmental awareness and conservation. It enhances the awareness of environmental problems and understanding of environmental challenges. EE not only emphasis creation of awareness and understanding of environmental issues however it also plays a

crucial role in strengthening the environmental conservation. This paper concludes by highlighting the Environmental Education strategies for Environmental Conservation.

Introduction

In the present scenario, the over exploitation of the natural resources is immensely affecting the environment. The environmental challenges such as climate change, global warming, drought, floods, landslides, Pollution and related environmental issues decorating the environment. These challenges are not limited to natural environment, but they also affect the human health , economic activities , social well being and quality of life. Addressing such issues require individuals to become aware and understand the urgency to recognise their responsibility towards Environment and its protection . Therefore to spread awareness regarding the environmental issues among the youth can be made possible through understanding the core concept of Environmental Education. The term environmental education was first appeared in 1947. EE is defined in many ways, but each definition considers it to be a discipline or process that teaches us how to behave in a manner that fosters the responsible management of our environment and resources (Fang et al., 2018). Environmental Education as a process producing a citizenry that is knowledgeable concerning the biophysical environment and its associated problems, aware of how to help solve these problems, and motivated to work toward their solution (Stapp et al. 1969:30–31). According to Vladova (2023), Environmental Education is an important tool for fostering environmental literacy, environmental awareness and sustainable development. He defines EE as a process that empowers people to engage in problem solving , explore environmental issues and take actions to improve the environment. Cerovsky (1971, p. 4) defined environmental education as,

...a process of recognizing values and clarifying concepts in order to develop skills and attitudes necessary to understand and to appreciate the interrelatedness among man, his culture, and his biophysical surroundings. Environmental education is also entailed practice in decision-making and self-formulation of code behavior about issues concerning environmental quality.

EE is a process to promote the awareness and understanding of the environment its relationship with man and his activities. It is also aimed at developing responsible actions necessary for preservation, conservation and improvement of the environment and its components (Saxena, n.d.,1986). EE is the teaching of individuals and communities in transitioning to a society that is knowledgeable of the environment and its associated problems, aware of the solutions to these problems and motivated to solve them. In a nutshell,

Environmental education is provided so that people can have better understanding of the world around them and to know how to take care of it properly so that the world can be a better place. It is a multidisciplinary field integrating disciplines such as biology, chemistry, physics, ecology, earth science, atmospheric science, mathematics, and geography (Dr. Shyama Prasad Mukherjee University, Ranchi, n.d.).

Origin of Environmental Education

The environmental education has developed when the United Nations Conference on the Human Environment (UNCHE) held in Stockholm Sweden in 1972, was the first step towards putting environment concern's on the global agenda. The most important outcome of this conference was the establishment of United Nations Environment Programme (UNEP) developed to coordinate environmental activities within UN system and foster environmental awareness and action worldwide (United Nations,1972). In 1975, the Belgrade Charter provided the goals, objectives and guiding principles of environmental education. This was developed during the International Workshop on Environmental Education held in Belgrade. It highlighted that environmental education should develop a world population. That is aware of and concerned about the environment. And its related problems.(UNESCO -UNEP, 1976). Tbilisi Declaration organized by UNEP and UNESCO in Tbilisi, 1977. It is considered the foundation document of environmental education because it clearly defined the objectives, characteristics, principles and strategies of environmental education at the international level.(UNESCO, 1978).

Agenda 21, a comprehensive action plan for sustainable development in the 21st century emphasized the integration of environment and development concerns and encouraged the participatory community based approaches to Sustainability was the major outcome of the Rio Earth Summit also known as United Nations Conference on Environment and Development (UNCED) was held in 1992.(

United Nations,1992). This period marked the introduction of Education for

Sustainable Development (ESD) . In 1997, a special session of the UN General Assembly Rio+5 devoted itself to evaluating the progress made since the Rio Summit. A ten year assessment of Rio outcomes (Rio+10)took the shape of World Summit on Sustainable Development (WSSD) held at Johannesburg in 2002. This summit highlighted the role of education in addressing environmental challenges and strengthening global commitment toward sustainable development(United Nation,2002). United Nations Decade of Education for Sustainable Development (2005-2014) was launched by UNESCO to encourage sustainability oriented education to foster sustainable lifestyle, social responsibility and environmental ethics(UNESCO,2004). In 2009, A UNESCO World Conference on Education for sustainable development

was held in Bonn Germany which resulted in the Bonn declaration, emphasizing the role of education in addressing the global environmental and sustainability challenges(UNESCO,2009). In India. Environmental education gain momentum after the recommendations of the Tbili declaration and later through the efforts of UGC, NCERT and the Ministry of Environment, Forest and Climate Change. Environmental education was further strengthened when the Supreme Court of India directed educational institutions to introduce environmental studies as a compulsory subject in 2003.Thus Environmental education originated as a response to global environmental concerns and gradually evolved into an interdisciplinary field aimed at developing environmentally responsible citizens.

Objectives of Environmental Education

Environmental education aims to impart knowledge about the principles required for the conservation and utilization of the natural resources for the existence of the mankind (Dr. Shyama Prasad Mukherjee University, n.d.).

Dr. Shyama Prasad Mukherjee University (n.d.) stated the major objectives of environmental education are:

- To develop awareness about the environment.
- To create awareness about the environmental challenges and issues.
- To develop the necessary skills and expertise to address the challenges.
- To promote the understanding of how natural environments function and how human beings can manage behaviour and ecosystem sustainably.
- To promote education directed toward the protection and enhancement of the environment .
- To implement the goals of environmental Protection and conservation.

Components of Environmental Education

Environmental education aims to create a population that is knowledgeable about environmental problems and motivated to work toward their solutions (Stapp et al., 1969) . According to UNESCO (1978), the major objectives of environmental education are mentioned below:

- **Awareness**

Environmental Education helps individuals and communities develop awareness and sensitivity towards the environment and environmental issues (UNESCO, 1978).

- **Knowledge**

Environmental Education provides people with knowledge and understanding of the environment, environmental challenges, and the relationship between humans and nature (UNESCO, 1978).

- **Attitudes**

Environmental Education develops positive attitudes, values, concern and commitment towards Environmental Protection and improvement (UNESCO, 1978).

- **Skills**

Environmental Education helps individuals acquire the skills necessary to identify, prevent, and solve environmental problems effectively (UNESCO, 1978).

- **Participation**

Environmental Education encourages active participation at individual and community levels in environmental decision making and conservation activities (UNESCO, 1978).

Hungerford and Volk (1990) emphasized that the ultimate aim of Environmental Education is to develop environmentally responsible behaviour among individuals.

National and Global Environmental Issues

In 21st century, environmental issues have become a topic of great concern. It requires humans who have a sense of responsibility and a sense of mutual need for the environment to overcome the complex environmental problem. Environmentalists from various countries in the world have highlighted the environmental problems (Timbema,2020).

In 1972, The UN Conference on the Environment was held in Stockholm. Which led the world to commemorate Simple Environment Day on 5 June each year, This day does not only remind us of the importance of conserving the environment, however rather to make efforts that are one of our responsibilities as humans. We always believe as beings who have wisdom in living life since the UN

conference a world institution deals with. The environmental issues has been formed, namely United Nations Environmental Program (Timbema,2020).

National Environmental Issues

India faces several environmental challenges, including air pollution, water pollution, solid waste management issues, noise pollution, and land degradation (Pawar, 2017).

Air Pollution

In India, air pollution is a serious issue with the major sources being fuel wood and biomass burning, fuel adulteration, vehicle emission and traffic congestion. Fuel wood, Agri-waste and biomass cake burning releases over 165 million tonnes of combustion products into India's indoor and outdoor air every year. These biomass-based household stoves in India are also a leading source of greenhouse emissions contributing to climate change. India is the world's largest consumer of fuel, wood, agricultural waste and biomass for energy purposes. Air pollution is also the main cause of the Asian brown cloud, which is causing the monsoon to be delayed (Pawar,2017).

The metropolitan cities of India are exposed to unhealthy and unhygienic conditions due to air pollution(Dutta et al.,2021).The alarming increase of Urban Air pollution is an emerging environmental issue in the Indian megacities for the last few decades (Faheem et al.,2021).

Water Pollution

In India, water pollution has now reached a critical point. The discharge of untreated sewage is the most important cause for pollution of surface and groundwater in India. The majority of government owned sewage treatment plants remain closed most of the time due to improper design or poor

maintenance or lack of reliable electricity supply to operate the plants, together with absentee employees and poor management, the waste water generated in these areas are normally percolates in the soil or evaporates. The uncollected wastes accumulates in the urban areas cause unhygienic conditions and release pollutants that leaches to surface and groundwater (Pawar,2017).

Solid Waste Pollution

India generates 160038.9 tonnes per day of solid waste, of which 152749.5 tonnes per day gets collected at a collection of efficiency of 95.4%, 50% of waste gets treated , and 18.4% gets landfilled leading to the

generation of leachate, which degrades surrounding soil and water resources in the vicinity and impacts the health of residents (Cremuato et al.,2018;Mondal &Mandal,2024; Rouhi et al.,2024).

In rural and urban areas of India, trash and garbage is a major source of pollution. Indian cities alone generate more than 100 million tonnes of solid waste a year. Public places and sidewalks are despoiled with filth and litter. Rivers and canals act as garbage dumps. In part, India's garbage crisis is from rising consumption (Pawar,2017).

Noise Pollution

In India, noise pollution is the most prevalent kind of pollution that may harm the activity or balance of human or animal life. The source of most outdoor noise worldwide is mainly caused by machines and transportation systems, motor vehicles, aircraft and trains. In India, the outdoor noise is also caused by loud music during festival season. Poor urban planning may give rise to noise pollution since side by side industrial and residential buildings can result in noise pollution in residential areas (Pawar,2017).

Soil Pollution

Soil pollution it results from various anthropogenic and natural activities, leading to the contamination of soil with toxic chemicals, waste, and pathogens. The key sources of soil pollution include industrial activities, agricultural practices, urbanization, and improper waste disposal. It directly affects soil health, agriculture, ecosystem and human health. Pollutants such as heavy metals, pesticides, plastics and pathogens have severe effects on soil ecosystem, reducing its fertility, biodiversity and productivity. Soil pollution possesses significant health risk, such as food contamination and water pollution, and contributes to environmental degradation (koushal et al.,2025)

Global Environmental Issues

The environment is crucial for sustaining life on earth but the rising global environmental problems have become a significant concern in recent years(Singh,2015; Ukaogo et al.,2020). Some of the major global environmental issues are highlighted below:

Pollution

Pollution in environment can occur in different forms including air pollution, water pollution, noise pollution, and soil pollution (Nnaemeka,2020). Air pollution has become a global problem and must be

addressed. Severe pollution of the ozone has also been reported in China. As a result, China is now considered a hotspot for ozone pollution globally(Li et al.,2019;Lu et al.,2018).

Global Warming

Global warming is one of the most serious environmental issue worldwide. It is primarily caused by the increased concentration of greenhouse gases from burning fossil fuels, deforestation and industrial activities. Consequences include rising global temperature, melting glaciers, sea level lights, extreme weather events, droughts and floods (UNEP, 2019).

Biodiversity Loss

The rapid decline of flora and fauna threatens ecosystem stability and human wellbeing. Major drivers include habitat destruction, climate change, pollution, invasive species and overexploitation of natural resources. Biodiversity loss also increases the risk of infectious disease outbreaks (UNEP, 2023).

Deforestation

Deforestation refers to the forest that are being cleared for agriculture, urbanization, mining and infrastructure development. Deforestation contributes to biodiversity loss, disrupts water cycles, increases soil erosion and ex. Urbates climate change by reducing carbon. Sequestration (UNEP, 2023).

Land degradation

Deforestation, mining, urban expansion and unsustainable agricultural practices lead to soil degradation and desertification these processes reduce agricultural productivity and threaten food security (UNEP,2019).

Role of Environmental Education in addressing National and Global

Environmental Issues

Environmental education is a widely recognised field for addressing environmental challenges at both national and global levels. It aims to develop environmental literacy by enhancing individuals' knowledge, attitude, values, skills and participation in environmental protection and sustainable development. Through environmental education learners Become capable of understanding the interconnectedness between human activities and environmental processes and are better equipped to make informed decisions regarding environmental issues (Ardoin et al.,2020).

- **Enhancing Environmental Awareness and Knowledge**

Environmental education helps individuals understand the causes, consequences and solutions of environmental problems such as climate change, biodiversity loss, pollution, deforestation, resource depletion, land degradation and plastic pollution. Increased environmental knowledge is essential for fostering environmentally responsible behaviour and. Informed decision making among individuals (Ardoin et al.,2020).

- **Fostering Pro-Environmental Attitudes and Behaviors**

Molnár et al.(2026) reported that environmental education plays a significant role in fostering positive environmental attitudes, values and behaviours among individuals. By fostering environmental responsibility and stewardship, environmental education encourages people to adopt sustainable lifestyles and actively engage in conservation activities.

- **Conserving Biodiversity**

Environmental education plays an important role in biodiversity conservation by increasing biodiversity literacy and encouraging participation in conservation initiatives. Educational programmes help individuals recognize the importance of protecting ecosystem and endangered species, thereby supporting biodiversity preservation efforts (Fajri et al.,2025)

- **Developing Problem-Solving and Critical Thinking Skills**

Environmental issues are complex and interdisciplinary. Environmental education plays an important role in developing critical thinking, analytical abilities, and problem solving skills that enabled learners to evaluate environmental challenges and identify sustainable solutions. These competencies are important for addressing both local and global environmental issues (Brownlee et al.,2013)

- **Encouraging Community Participation and Environmental Education**

Environmental education encourages active participation in environmental decision-making and community based conservation efforts and programs. Studies have shown that educational initiatives that focus on local environmental issues and action oriented learning are more likely to produce measurable conservation outcomes (Ardoin et al.,2020).

- **Supporting Sustainable Development**

Environmental Education contributes to sustainable development by fostering responsible consumption, resource conservation and environmental citizenship. It empowers individuals to balance environmental, economic and social considerations when making decisions that affect present and future generations (Ardoin et al.,2020).

Environmental Education strategies for Environmental Conservation

Environmental education plays a significant role in fostering environmental conservation by equipping individuals with the knowledge, skills, values ,attitudes and motivation necessary to protect and improve the environment. Several strategies have been identified in the literature to enhance effectiveness of environmental education programmes.

- **Environmental Awareness and Sensitisation**

Awareness programs helps an individual to understand the environmental issues and recognize the importance of conservation of environment and foster the pro- environmental behaviour among individuals (Palmer,1998)

- **Experimental learning**

Experiential learning can bridge the gap between the theoretical knowledge and the real world environmental action, fostering deeper connections to nature and a sense of responsibility for its stewardship. Activities like field work, internships, and lab experiments allow students to engage directly with conservation efforts such as habitat restoration, water quality testing, and renewable energy development (Sharma,2023).

- **Eco Clubs**

Eco Clubs encourage students to participate in initiatives like tree planting, clean-ups and waste management programs.These clubs organise awareness campaigns and educational events, nurturing teamwork, leadership and project management skills. By fostering responsibility and creativity, Eco Clubs motivate students to become environmental champions (Patra & Bhoi ,2025).

- **Recycling Initiatives**

School recycling programs teach students resource management and waste reduction through activities like waste sorting composting and upcycling these initiatives forced a sustainability and instil lifelong habits of environmental responsibility while nurturing leadership and innovation (Patra & Bhoi ,2025).

- **Nature Excursions and Education outside the School**

Field trips , nature camps allows individuals to directly connect with the environment, enhancing their understanding of biodiversity and ecological systems(Zhang et al.2022). These allow individuals to explore the environment and foster their environmental awareness and promote conservation of environment.

Conclusion

Environmental education is a dynamic process. It prepare individuals for life through an understanding of the major issues such as climate change , deforestation, ozone layer depletion, pollution, biodiversity loss of the contemporary world. These challenges pose significant threats to ecological sustainability. Addressing these environmental concerns requires active participation of informed and environmentally responsible citizens. In this context, environmental education has been widely recognized as an essential tool to support and encourage environmental literacy and promote sustainable behaviour among individuals. Hungerford and Volk (1990) emphasized that environmental education plays significant role in influencing the responsible environmental behaviour through the development of environmental awareness, knowledge and action competencies. Palmer (1998) argued that environmental education enables individuals to understand the interconnectedness between human activities and environmental systems thereby encouraging environmental stewardship. Community participation and collaborative environmental action also strengthen conservation efforts by transforming individual awareness into collective responsibility (Monroe et al.,2019). In essence, environmental education is an effective tool for addressing environmental issues and strengthening environmental conservation . Therefore, great emphasis should be done in integration of environmental education to build environmentally responsible citizens.
